## Document Control

### Approval

The Guidance Team and the customer shall approve this document.

### Document Change Control

Initial Release:	1.0
Current Release:	3.0
Indicator of Last Page in Document:	[END]
Date of Last Review:	05/09/2020
Date of Next Review:	N/A
Target Date for Next Update:	N/A

### Distribution List

This following list of people shall receive a copy of this document every time a new version of this document becomes available:

Guidance Team Members:

Dr. Ann Gates, Dr. Steve Roach, Mr. Jake Lasley

Clients:

Mr. Vincent Fonseca, Mr. Baltazar Santaella, Ms. Herandy Vazquez, and Mr. Erick De Nava

Software Team Members:

Mr. Anthony Desarmier, Mr. Angel Villalpando, Mr. Mario Delgado, Mr. David Rayner,  
Mr. Valentin Becerra, Mr. Jorge Garcia

### Change Summary

The following table details changes made between versions of this document

Version	Date	Modifier	Description
0.1	02/26/2020	Jorge Garcia	Added Template
1.0	03/08/2020	Anthony DesArmier	Wrote class descriptions, contracts, responsibilities; wrote protocols for Event, wrote sections 2, 2.2, 2.3
1.0	03/08/2020	Jorge Garcia	Added class descriptions from CRC, wrote section 1.5 and updated references.
1.0	03/09/2020	David Rayner	Completed section 1.1 Completed Component Diagram section 2.1.
2.0	03/13/2020	David Rayner	Refactored contracts changed collaboration diagram and updated section 2.2 with new contracts.
2.1	03/25/2020	David Rayner	Completed protocols for Vector, ActiveVector, IDDict, SplunkManager and EAR.
2.2	03/24/2020	Valentin Becerra	Completed protocols for ExportGraph
2.3	03/25/2020	Valentin Becerra	Completed protocols for Relationship
2.4	03/26/2020	Valentin Becerra	Complete protocols for Node and Graph

<b>SDD</b>	<b>Keikaku 企画</b>	<b>Date</b> 05/09/2020	<b>Page</b> ii
------------	-------------------	---------------------------	-------------------

2.4	03/26/2020	Jorge Garcia	Complete protocols for ExportTable and ProjectMerge
2.4	03/27/2020	Angel Villalpando	Completed protocols for all contracts in History and Sync classes and completed the protocols for contracts 11, 12, and 13 in Settings class.
2.5	03/29/2020	Anthony DesArmier	Reviewed all protocols, updated section 2, formatting
3.0	05/09/2020	Anthony DesArmier	Added 4.7-4.9, 5.15-5.16, 6. Updated Collaboration Diagram. Formatting, grammar.
3.0	05/09/2020	David Rayner	Added UiSplunkConfig 3.3, updated validator. Worked on section 6.3, 6.4 and 6.6.
3.0	05/09/2020	Valentin Becerra	Worked on section 6.2, 6.3, 6.4, 6.5, 6.6, and 6.7
3.0	05/09/2020	Mario Delgado	Reviewed collaborations, section 6 and 4.

# 1 Introduction

## 1.1 Purpose and Intended Audience

The purpose of the Software Design Document is to guide the software team in the construction of the PICK system. It is a means of construction such that the client's requirements are to be satisfied. The design or architectural overview of the system is to model the components that interact within the system. The Software Design Document is also intended for the clients to further establish or maintain the system in the future. Thus, the document must be detailed enough to provide both the software team and clients with enough information regarding the system design as possible.

## 1.2 Scope of Product

The PMR Insight Collective Knowledge (PICK) is the software system for which this SDD is written for. PICK is a software system to help Prevent, Mitigate, and Recover Analysts analyze vast amounts of data collected during an Adversarial Assessment (AA) by allowing them to quickly search through, view, correlate, and build visual documents which help explain the AA itself to uninvolved personnel. The customers - in this case PMR Analysts - currently must sift through the vast amounts of generated data from the AA by hand which severely hinders their workflow and efficiency in developing a report with visual aids for which to explain the nature of the AA to other personnel.

PICK will allow the customers to insert all the data generated from an AA into its system and display an organized, searchable database of that information. The customers can then quickly and efficiently find and correlate relevant data events together and help craft timelines which describe the significant events and their relations to one another during the AA. PICK will then assist the customers in crafting a visual representation of these series of events as attack graphs in order to help visualize the timeline of the AA. This assistance of analyzing the data generated by the AA and constructing visual representations of significant events will substantially reduce the time and work hours needed by the customers to understand and construct a report on the results of the AA to deliver to other personnel.

## 1.3 Definitions, Acronyms, and Abbreviations

### 1.3.1. Definitions

**Table I.**  
**Definitions of Complex Terms Found Within this Document**

TERM	DEFINITION
Adversarial Assessment	An <i>Adversarial Assessment</i> gauges the ability of a system to support its mission(s) while withstanding validated and representative cyber threat activity [1]-[4].
Analyst	An Analyst is the end user who is evaluating log entries and associating them to their respective vectors. Their sole purpose is to generate a picture of the events taken place during an AA [1]-[4].
Log	A log is a series of noted occurrences or events that describe the events that have taken place during an AA [1]-[4].
Vector	A vector is a series of events an adversary attempts to execute in order to achieve an objective or series of objectives. In this context, Red team attack initiatives and Blue team defenses [4].
Vector Table	A vector table is a representative tabular view of vector properties this includes, vector name, vector description, and the vector's nodes [4].
Vector Element	A vector element is either a Node or a Relationship that can be added to a Vector [4].
Validator	A Validator performs the validation of the raw log files based on the criteria provided by the PMR Analyst [4].
Graphical View	A vector visualization or graphical view of the respective vector. This includes the circular nodes with image icons and their connections denoted with directional lines [4].
Event	An event is a log entry consisting of a timestamp and a textual description or message of what took place [2], [3].
Node	A node is representative of a significant event, that is an event an analyst assigns to a vector and is marked as visible on a Vector table [1]-[4].
Relationship	A relationship is a connection between a parent node to their child nodes. It is how the nodes/events are associated [1]-[4].
Attack Graph	An attack graph is a succinct representation of data structures that model all possible avenues of attacking a network [1]-[4].
White Team	White team represents the third party LSH members or analysts that observe the AA events [1]-[3].
Red Team	Red team represents the team that perform cyber-attacks on a combat system [1]-[4].
Blue Team	Blue team represents the defense team, or the team that responds to the Red team cyber-attacks [1]-[4].
Constraint	A system limitation, or the bounds to which the system can operate.
Configuration	Parameters that are defined by the Analysts regarding the AA's details [4].
Regular Expression	A search pattern consisting of a sequence of characters [1]-[3].
Property	An attribute or characteristic that belongs to an object [4].
Ingest	The intake of files [1]-[3].
Parse	The separation of text to smaller more manageable parts.
Interactive	User-system interaction, system responses to user inputs.
Prompt	Pop-up window used to display an alert or dialog of information

Enforcement Action Report	Report that outlines various errors found in validation and solicits the user for an enforcement action.
Push	The sending of committed changes to a remote repository.
Pull	The fetching and downloading of content from a remote repository and immediately updating the local repository to match that content.

### 1.3.1 1.3.2. Acronyms

## 1.5 Overview

The SDD describes the system at an architectural level providing a high-level description of subsystems, data management and other system components. Such descriptions have been provided in the following sections.

Section 2: Decomposition Description includes a System Collaboration Diagram in the form of a UML Component Diagram. This provides the system’s relationships with its subsystems. This also includes a list of all subsystem descriptions and the contracts their components fulfill.

SDD	Keikaku 企画	Date 05/09/2020	Page 3
-----	------------	--------------------	-----------

Section 3 provides a detailed description of the User Interface subsystem. This subsystem is responsible for accepting and handling all user input. Additionally, it is also responsible for displaying all the internal system data.

Section 4 provides a detailed description of the Adversarial Assessment Data Processing subsystem. This subsystem is responsible for ingesting user provided files, relaying the files to Splunk and retrieving the data generated from said files.

Section 5 provides detailed information on the Internal Data Store subsystem. This subsystem is responsible for all the data persistence it is also responsible for all the maintenance of the configurable items in the system.

Section 6 provides detailed information on the Graph subsystem. This subsystem is responsible for the displaying and the manipulation of the node and relationship data found within a vector.

<b>SDD</b>	<b>Keikaku 企画</b>	<b>Date</b> 05/09/2020	<b>Page</b> 4

## 2 Decomposition Description

The decomposition description can be used by designers and maintainers to identify the major design entities of the system for purposes such as determining which entity is responsible for performing specific functions and tracing requirements to design entities. Design entities can be grouped into major classes to assist in locating information and to assist in reviewing the decomposition for completeness.

The information in the decomposition description can be used by project management for planning, monitoring, and control of a software project. They can identify each software component, its purpose, and basic functionality. This design information together with other project information can be used in estimating cost, staff, and schedule for the development effort.

2.1 System Collaboration Diagram

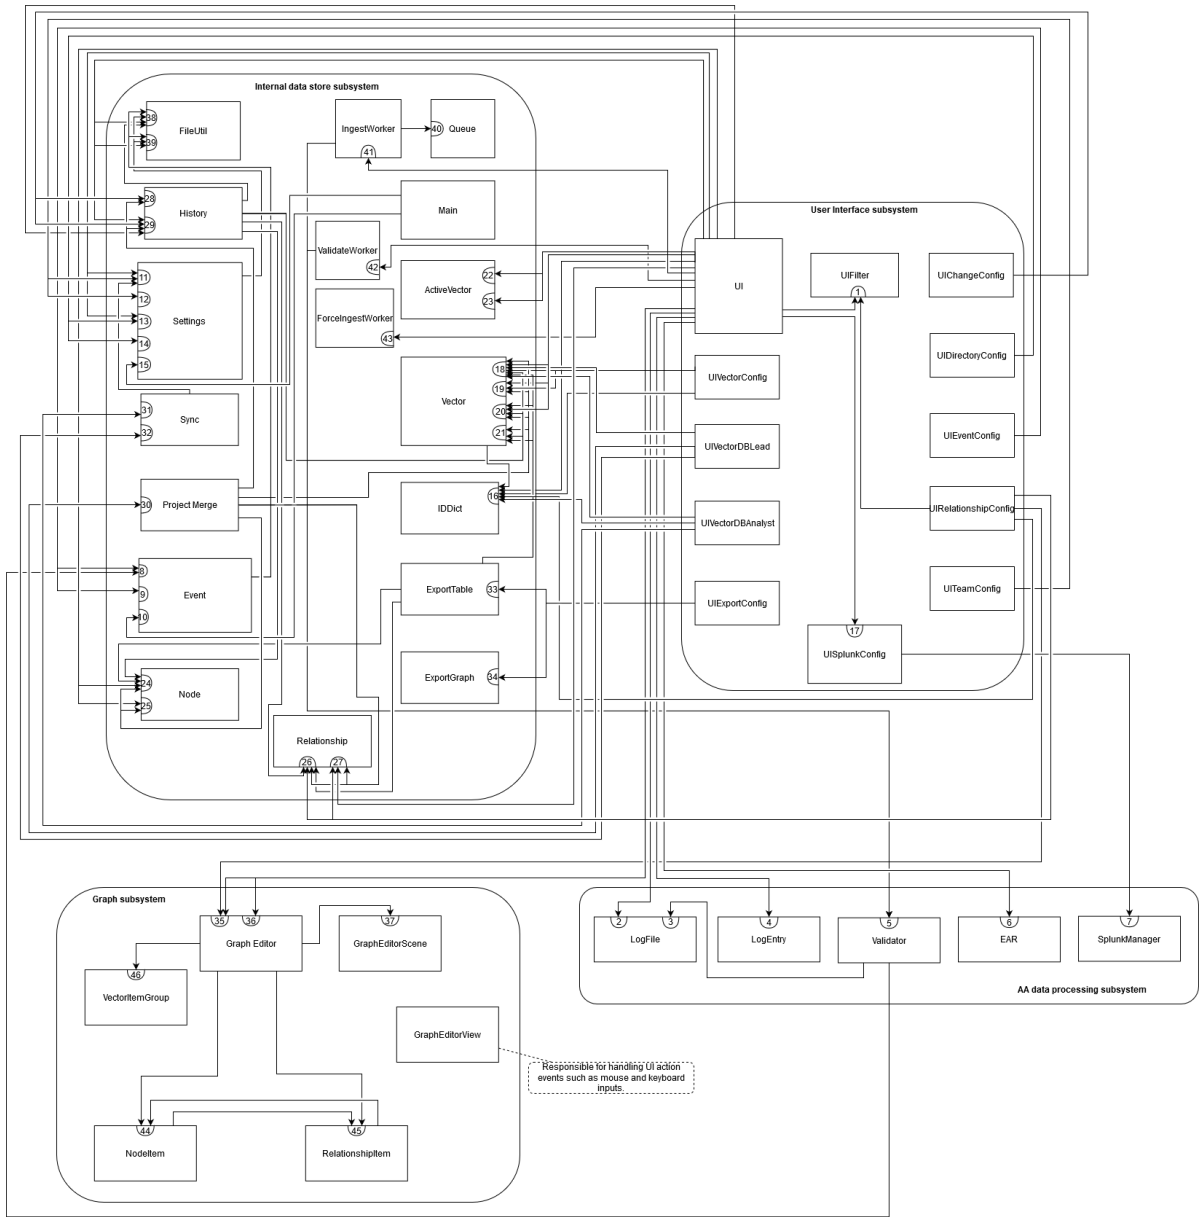

Fig. 1. UML Collaboration Diagram for the PICK System, 2020.

The system has been structured loosely on the model-view design pattern with further separation within the model component to separate distinct and independent functionality and purpose. The User Interface subsystem serves as both the view and controller components for the other subsystems. The Adversarial Assessment Data Processing, Internal Data Store, and Graph subsystems each represent a distinct and separate core function and service to the system.

## 2.2 Subsystem and Component Descriptions

The User Interface subsystem accepts user input for control of the other subsystems and displays internal system data. This subsystem is comprised of the following components:

1. UI: The main window which provides the bulk of the system's interface. (3.2)  
No Contracts
2. UiDirectoryConfig: The directory window which handles the setting of file directory paths. (3.3)  
No Contracts
3. UiEventConfig: The event window which handles the setting of project event information. (3.4)  
No Contracts
4. UiExportConfig: The export window which handles exporting vector and entry data to an external file. (3.5)  
No Contracts
5. UiFilterConfig: The filter window which handles the creation and application of a search filter. (3.6)
  1. Provide filter.
6. UiTeamConfig: The team window which handles the system role and connections to the host when running as a client. (3.7)  
No Contracts
7. UiVectorConfig: The vector window which handles the adding, editing, and deleting of vectors and their descriptions. (3.8)  
No Contracts
8. UiRelationshipConfig: The relationship window which handles the relationship table for the active vector. (3.9)  
No Contracts
9. UiVectorDBAnalyst: The analyst vector DB window which handles the pulling and pushing of vector changes between the analyst and host systems. (3.10)  
No Contracts
10. UiVectorDBLead: The lead vector DB window which handles the accepting of queued analyst push requests. (3.11)  
No Contracts
11. UiCommitConfig: The commit window which handles the committing of log entry and vector changes. (3.12)  
No Contracts
12. UiSplunkConfig: The Splunk window which handles the connection to a Splunk server. (3.13)
  17. Provide Splunk connection.

The Adversarial Assessment Data Processing subsystem is responsible for ingesting user-provided files, validating them, sending them to Splunk for processing, and retrieving the Splunk-generated log entries for analyst processing and manipulation in the PICK system. This subsystem is comprised of the following components:

1. LogFile: responsible for reading the user-provided directory path and importing the contents of the file. (4.2)
  2. Provide file status.
  3. Save file status.
2. LogEntry: responsible for storing the indexed entries in a log file. (4.3)
  4. Provide entry details.
3. Validator: responsible for validating and cleansing the content of user-provided files. (4.4)
  5. Cleanse and validate log files.
4. EnforcementActionReport: responsible for a report that outlines various errors found in validation. (4.5)
  6. Provide enforcement action report.
5. SplunkManager: responsible for the interface between Splunk and the system to submit log files and retrieve log entries. (4.6)
  7. Generate log entries from Splunk.
6. IngestWorker: A thread routine for performing ingestion into Splunk. (4.7)
  41. Ingest log file data.
7. ValidateWorker: A thread routine for validating logfiles. (4.8)
  42. Validate log file data
8. ForceIngestWorker: A thread routine for performing forced ingestion into Splunk. (4.9)
  43. Force ingest log file data.

The Internal Data Store subsystem is responsible for the maintenance and persistence of user-provided, configurable items. Such items can include customized event names, vector names, vector components such as nodes and relationships, and any other labels or data that the system allows the user to personalize. This subsystem is comprised of the following components:

1. Main: serves as an entry and exit point to the system. (5.2)
  - No Contracts
2. Event: responsible for maintaining the information and attributes that describe the specific event for an analysis/session. (5.3)
  8. Provide event details.
  9. Save event details.
  10. Save-load event object.
3. Settings: responsible for housing global variables of a given event/session. (5.4)
  11. Provide networking details.
  12. Save networking details.
  13. Provide directory details.
  14. Save directory details.
  15. Save-load setting object.
4. IDDict: responsible for storing a map of generic objects and their unique id. (5.5)
  16. Modify dictionary.
5. Vector: responsible for storing the data of nodes and relationships that compose a vector. (5.6)
  18. Provide vector details.
  19. Save vector details.
  20. Modify node dictionary.
  21. Modify relationship dictionary.

SDD	Keikaku 企画	Date 05/09/2020	Page 8
-----	------------	--------------------	-----------

6. ActiveVector: responsible for storing the currently selected vector and its unique id. (5.7)
  22. Provide active vector details.
  23. Save active vector details.
7. Node: responsible for the storage of log entry properties. (5.8)
  24. Provide node details.
  25. Save node details.
8. Relationship: responsible for storing the child and parent node IDs that constitute a given relationship in the system. (5.9)
  26. Provide parent-child node relationship details.
  27. Save parent-child node relationship details.
9. History: responsible for storing the vectors', nodes' and relationships' history of changes and saving them. (5.10)
  28. Display history of changes.
  29. Save changes.
10. ProjectMerge: responsible for the merging of analyst and lead history changes.
  30. Merge data. (5.11)
11. Sync: responsible for handling data transferal from lead and client. (5.12)
  31. Provides push/pull request changes to lead.
  32. Modify push request queue.
12. ExportTable: responsible for the formatting of the log entry tables that compose the vectors of a given event into an exportable file. (5.13)
  33. Save tables to file.
13. ExportGraph: responsible for the formatting of the final graph with its corresponding vector into an exportable image file. (5.14)
  34. Save graph to image file.
14. FileUtil: A set of subroutines related to file processing. (5.15)
  38. Save object to file.
  39. Read object from file.
15. Queue: A simple queue implementation. (5.16)
  40. Provide queue functionality.

The Graph subsystem is responsible for the displaying and the manipulation of the node and relationship data found within a vector. This subsystem is comprised of the following components:

1. GraphEditor: responsible for rendering nodes, relationships, their relative positions, and their properties for a given vector. (**Error! Reference source not found.**)
  35. Add/remove/edit items from the view.
  36. Toggle and display vector items
2. GraphEditorScene: responsible for acting as a drawing surface to all objects to the panel. (6.3)
  37. Add/remove items to the surface and ready for rendering.
  38. Add/remove/edit items from the view
3. GraphEditorView: responsible for rendering items and handling user events upon the panel. (6.4)
  - No Contracts
4. NodeItem: responsible for a node representation upon the panel. (6.5)
  44. Handle changes in text and position.
5. RelationshipItem: responsible for a relationship representation upon the panel. (6.6)
  45. Dynamically display relationship line with parent and child nodes.
6. VectorItemGroup: responsible for handling a group of vector representations and switching between each to display to the panel. (6.7)
  46. Handle addition, removal and visibility of vectors.

SDD	Keikaku 企画	Date 05/09/2020	Page 9
-----	------------	--------------------	-----------

## 2.3 Dependencies

Since the User Interface subsystem displays and controls all other subsystems, this subsystem needs to be developed first. The Adversarial Assessment Data Processing, Internal Data Store, and Graph subsystem are patterned on the specific workflow sequence of the system and thus each subsystem is generally dependent on the previous subsystem to perform any meaningful functions. Therefore, the Adversarial Assessment Data Processing, Internal Data Store, and Graph subsystem should be developed in sequence.

<b>SDD</b>	<b>Keikaku 企画</b>	<b>Date</b> 05/09/2020	<b>Page</b> 10
------------	-------------------	---------------------------	-------------------

## 3 User Interface: Detailed Description

### 3.1 Component Description

The User Interface subsystem accepts user input for control of the other subsystems and displays internal system data. This subsystem is composed of the Ui, UiDirectoryConfig, UiEventConfig, UiExportConfig, UiFilterConfig, UiTeamConfig, UiVectorConfig, UiRelationshipConfig, UiVectorDBAnalyst, UiVectorDBLead, UiChangeConfig, and UiSplunkConfig classes.

### 3.2 Class Description: Ui

### 3.4 Class Description: UiEventConfig

The event window which handles the setting of project event information.

<b>Class Name:</b> UiEventConfig	
<b>Superclass:</b> QDialog	
<b>Subclasses:</b> None	
Private Responsibilities:	Collaborations

SDD	Keikaku 企画	Date 05/09/2020	Page 12
-----	------------	--------------------	------------

<ul style="list-style-type: none"> <li>• Displays event name.</li> <li>• Displays event description.</li> <li>• Displays event start timestamp.</li> <li>• Displays event end timestamp.</li> <li>• Collects event name.</li> <li>• Collects event description.</li> <li>• Collects event start timestamp.</li> <li>• Collects event end timestamp.</li> <li>• Saves event information to file.</li> </ul>	Event 1 Event 2 Event 3 Event 4 Event 5 Event 6 Event 7 Event 8 Event 9
<b>No Contracts</b>	

### 3.5 Class Description: UiExportConfig

The export window which handles exporting vector and entry data to an external file.

<b>Class Name:</b> UiExportConfig	
<b>Superclass:</b> QDialog	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b>	<b>Collaborations</b>
<ul style="list-style-type: none"> <li>• Collects specified directory.</li> <li>• Collects directory file format.</li> <li>• Collects name for exported file.</li> <li>• Creates an image file of vector graph.</li> <li>• Creates a csv file of vector table.</li> </ul>	ExportGraph 1 ExportTable 1
<b>No Contracts</b>	

### 3.6 Class Description: UiFilterConfig

The filter window which handles the creation and application of a search filter.

<b>Class Name:</b> UiFilterConfig	
<b>Superclass:</b> QDialog	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b>	<b>Collaborations</b>
<ul style="list-style-type: none"> <li>• Collects keywords to search for in generated log entries, nodes, and relationships.</li> <li>• Collects the start/end timestamp search-criteria to apply to generated log entries and nodes.</li> <li>• Collects the “creator” (red, white, or blue) search criteria for generated log entries and nodes.</li> <li>• Collects the “event type” (red, white, or blue) search-criteria for generated log entries and nodes.</li> </ul>	
<b>Contract:</b> 1. Provide filter.	
<b>Responsibilities</b>	<b>Collaborations</b>
1. Knows keywords. <i>def get_keywords() -&gt; List:</i> <i>returns: List containing keyword strings.</i> <i>Retrieves the keywords from the filter.</i> <i>Pre: None</i> <i>Post: Returned list is non-null.</i>	
2. Knows timestamps.	

<b>SDD</b>	<b>Keikaku 企画</b>	<b>Date</b> 05/09/2020	<b>Page</b> 13
------------	-------------------	---------------------------	-------------------

<p><i>def get_timestamps() -&gt; List:</i>  <i>returns: List containing QDateTime stamps.</i>  <i>Retrieves the timestamp tamps from the filter.</i>  <i>Pre: None</i>  <i>Post: Returned list contains exactly one start datetime stamp and end datetime stamp.</i></p> <p>3. Knows “creators”.  <i>def get_creators() -&gt; List:</i>  <i>returns: List containing selected creators.</i>  <i>Retrieves selected creators from the filter.</i>  <i>Pre: None</i>  <i>Post: Returned list is non-null.</i></p> <p>4. Knows “event type”.  <i>def get_event_types() -&gt; List:</i>  <i>returns: List containing selected event types.</i>  <i>Retrieves selected event types from the filter.</i>  <i>Pre: None</i>  <i>Post: Returned list is non-null.</i></p>	
---	--

### 3.7 Class Description: UiTeamConfig

The team window which handles the system role and connections to the host when running as a client.

<b>Class Name:</b> UiTeamConfig	
<b>Superclass:</b> QDialog	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b>	<b>Collaborations</b>
<ul style="list-style-type: none"> <li>Displays lead status.</li> <li>Displays host machine IP address.</li> <li>Displays lead machine IP address.</li> <li>Collects lead status.</li> <li>Collects host machine IP address.</li> <li>Collects lead machine IP address.</li> <li>Displays number of connections to the lead machine IP address.</li> </ul>	Settings 1 Settings 3 Settings 2 Settings 4 Settings 6 Settings 5
<b>No Contracts</b>	

### 3.8 Class Description: UiVectorConfig

The vector window which handles the adding, editing, and deleting of vectors and their descriptions.

<b>Class Name:</b> UiVectorConfig	
<b>Superclass:</b> QFrame	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b>	<b>Collaborations</b>
<ul style="list-style-type: none"> <li>Displays vector name.</li> <li>Displays vector description.</li> <li>Collects vector name.</li> </ul>	IDDict 4; Vector 1 IDDict 4; Vector 2

## No Contracts

**3.12 Class Description: UiCommitConfig**

The commit window which handles the committing of log entry and vector changes.

<b>Class Name:</b> UiCommitConfig	
<b>Superclass:</b> QDialog	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b>	<b>Collaborations</b>
<ul style="list-style-type: none"> <li>• Display vector changes.</li> <li>• Display node changes.</li> <li>• Display relationship changes.</li> <li>• Saves vector changes.</li> <li>• Saves node changes.</li> <li>• Saves relationship changes.</li> </ul>	History 1 History 1 History 1 History 2 History 2 History 2
<b>No Contracts</b>	

**3.13 Class Description: UiSplunkConfig**

The Splunk window which handles the connection to a Splunk server.

<b>Class Name:</b> UiCommitConfig	
<b>Superclass:</b> QDialog	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b>	<b>Collaborations</b>
<ul style="list-style-type: none"> <li>• Displays user provided localhost.</li> <li>• Displays user provided port.</li> <li>• Displays user provided username.</li> <li>• Displays user provided password.</li> <li>• Collects user provided localhost.</li> <li>• Collects user provided port.</li> <li>• Collects user provided username.</li> <li>• Collects user provided password.</li> </ul>	
<b>Contracts:</b> 17. Provide Splunk connection.	
<b>Responsibilities</b>	<b>Collaborations</b>
1. Connects to Splunk. <i>def connect():</i> <i>Retrieves the strings from the input fields, establishes connections if valid.</i> <i>Pre: Local host and port and username and password are not empty strings.</i> <i>Post: Emits signal with connection object if connection details are valid.</i>	SplunkManager 3

## 4 Adversarial Assessment Data Processing: Detailed Description

### 4.1 Component Description

The Adversarial Assessment Data Processing subsystem is responsible for ingesting user-provided files, validating them, sending them to Splunk for processing, and retrieving the Splunk-generated log entries for analyst processing and manipulation in the PICK system. This subsystem includes the LogFile, LogEntry, Validator, EnforcementActionReport, SplunkManager, IngestWorker, ValidateWorker, and ForceIngestWorker classes.

### 4.2 Class Description: LogFile

The LogFile class is responsible for reading the user-provided directory path and importing the contents of the file.

<b>Class Name:</b> LogFile	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b>	<b>Collaborations</b>
<ul style="list-style-type: none"> <li>Creates copy of cleansed file.</li> <li>Records ingestion status.</li> <li>Records log file name.</li> <li>Records file path.</li> </ul>	
<b>Contract:</b> 2. Provide file status.	
<b>Responsibilities</b>	<b>Collaborations</b>
<ol style="list-style-type: none"> <li>Knows cleansing status.  <i>def get_cleansing_status() -&gt; bool:</i>  <i>returns: True if file was cleansed or required no cleansing, False if cleansing failed or has not been cleansed yet.</i>  <i>Retrieves the cleansing status of the logfile.</i>  <i>Pre: None</i>  <i>Post: Returned value is either True or False.</i> </li> <li>Knows validation status.  <i>def get_validation_status() -&gt; bool:</i>  <i>returns: True if file passed validation, False if file failed validation or has not been validated yet.</i>  <i>Retrieves the validation status of the logfile.</i>  <i>Pre: None</i>  <i>Post: Returned value is either True or False.</i> </li> <li>Knows ingestion status.  <i>def get_ingestion_status() -&gt; bool:</i>  <i>returns: True if file has been sent for ingestion, False if file has not been ingested yet.</i>  <i>Retrieves the ingestion status of the logfile.</i>  <i>Pre: None</i>  <i>Post: Returned value is either True or False.</i> </li> </ol>	

<p>4. Knows log file name.  <i>def get_name() -&gt; str:</i>  <i>returns: String representing the logfile name.</i>  <i>Retrieves the name from this logfile.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>5. Knows file path.  <i>def get_file_path() -&gt; str:</i>  <i>returns: String representing the logfile filepath.</i>  <i>Retrieves the filepath from this logfile.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>6. Knows enforcement action report.  <i>def get_ea() -&gt; EnforcementActionReport:</i>  <i>returns: EnforcementActionReport for this logfile.</i>  <i>Retrieves the EnforcementActionReport from this logfile.</i>  <i>Pre: None</i>  <i>Post: Returned EnforcementActionReport is non-null.</i></p>	
<b>Contract:</b> 3. Save file status.	
<b>Responsibilities</b>	<b>Collaborations</b>
<p>7. Records cleaning status.  <i>def set_cleansing_status (status: bool):</i>  <i>status: Boolean representing the status of cleansing.</i>  <i>Sets the cleansing status of the logfile.</i>  <i>Pre: status is non-null.</i>  <i>Post: Logfile attribute cleansed is set to status.</i></p> <p>8. Records validation status.  <i>def set_validation_status (status: bool):</i>  <i>status: Boolean representing the status of validation.</i>  <i>Sets the validation status of the logfile.</i>  <i>Pre: status is non-null.</i>  <i>Post: Logfile attribute validated is set to status.</i></p> <p>9. Records enforcement action report.  <i>def set_ea(ea: EnforcementActionReport):</i>  <i>name: String representing the event name.</i>  <i>Sets the Enforcement Action Report of the logfile.</i>  <i>Pre: ea is non-null.</i>  <i>Post: Logfile attribute ea is set to ea.</i></p>	

### 4.3 Class Description: LogEntry

The LogEntry class is responsible for storing the indexed entries in a log file.

<b>Class Name:</b> LogEntry			
<b>Superclass:</b> None			
<b>Subclasses:</b> None			
<b>Private Responsibilities:</b> None			
SDD	Keikaku 企画	Date 05/09/2020	Page 18

<b>Contract:</b> 4. Provide entry details.	
<b>Responsibilities</b>	<b>Collaborations</b>
<p>1. Knows entry timestamp.  <i>def get_timestamp() -&gt; str:</i>  <i>returns: String representing the entry timestamp.</i>  <i>Retrieves the timestamp for this entry.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>2. Knows entry description.  <i>def get_description() -&gt; str:</i>  <i>returns: String representing the entry description.</i>  <i>Retrieves the description from this entry.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>3. Knows entry line number.  <i>def get_line_number() -&gt; int:</i>  <i>returns: Integer representing the line number.</i>  <i>Retrieves the line number from this entry.</i>  <i>Pre: None</i>  <i>Post: Returned integer is non-negative.</i></p> <p>4. Knows log file path.  <i>def get_log_file_path() -&gt; str:</i>  <i>returns: String representing the entry log file path.</i>  <i>Retrieves the log file path from this entry.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p>	

#### 4.4 Class Description: Validator

The Validator class is responsible for validating and cleansing the content of user-provided files.

<b>Class Name:</b> Validator	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> <ul style="list-style-type: none"> <li>Remove non printable characters.</li> <li>Check timestamp bounds.</li> <li>Convert to standard date time.</li> </ul>	
<b>Contract:</b> 5. Cleanse and validate log files.	
<b>Responsibilities</b>	<b>Collaborations</b>

<p>1. Cleanses log files of empty lines/rows and unwanted non-printable characters.</p> <p><i>def cleanse(log_file_path: str, log_file_copy_path: str):</i>  <i>Reads from log_file_path strips of empty rows and unwanted TMUX characters, writes to the new log_file_copy_path.</i>  <i>Pre: logfile is non-null.</i>  <i>Post: log_file_copy_path is non-null and does not contain any empty rows or unwanted TMUX characters if applicable.</i>  <i>An Enforcement Action Report is generated if the process could not be completed. The logfile's cleansing status is set.</i></p> <p>2. Validates log files' timestamps.</p> <p><i>def validate(log_file_path: str) -&gt; dict</i>  <i>returns: a dictionary of errors.</i>  <i>Validates the log_file against the start and end timestamps.</i>  <i>Pre: log_file is non-null.</i>  <i>Post: An Enforcement Action Report is generated if the log file failed validation.</i></p> <p>3. Creates file copy path</p> <p><i>def create_file_copy(log_file_path, directory_path: str) -&gt; str</i>  <i>returns new file path in the given directory.</i>  <i>New file path is created with the with the log_file_path and directory_path.</i>  <i>Pre: log_file_path is valid and directory path is valid.</i>  <i>Post: New log_file_path is created with log_file_path and directory.</i></p>	Event 3-4
---	-----------

## 4.5 Class Description: EnforcementActionReport

The EnforcementActionReport is responsible for a report that outlines various errors found in validation.

<b>Class Name:</b> EnforcementActionReport	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> None	
<b>Contract:</b> 6. Provide enforcement action report.	
<b>Responsibilities</b>	<b>Collaborations</b>
<p>2. Knows errors found within log file.</p> <p><i>def generate_ear(file_path: str) -&gt; dict:</i>  <i>returns: Dictionary of line number : error message found within file.</i>  <i>Retrieves the list of errors.</i>  <i>Pre: None</i>  <i>Post: If no errors found returned list is null, otherwise non-null list is returned.</i></p>	

## 4.6 Class Description: SplunkManager

The SplunkManager class is responsible for the interface between Splunk and the system to submit log files and retrieve log entries.

<b>Class Name:</b> SplunkManager	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> <ul style="list-style-type: none"> <li>Know configuration details</li> <li>Create index for log entry storage</li> </ul>	
<b>Contract:</b> 7. Generate log entries from Splunk.	
Responsibilities	Collaborations
1. Sends log file to Splunk. <i>def add_file(file_path: str, index_name: str):</i> <i>Add file to Splunk index.</i> <i>Pre: file_path is valid.</i> <i>index_name is valid.</i> <i>Post: Log file log entries are stored on Splunk index.</i>	
2. Retrieves parsed log entries. <i>def search(query: str) -&gt; dict:</i> <i>dict: Dictionary representing the query results.</i> <i>Retrieves the log entries from Splunk.</i> <i>Pre: Query is valid.</i> <i>Post: Returned dictionary is non-null.</i>	
3. Connects to Splunk <i>def connect(host: str, port: str, username: str, password: str):</i> <i>Establishes a connection to Splunk.</i> <i>Pre: Host, port, username, and password strings are non-empty.</i> <i>Post: Throws Exception if provided host, port, and credentials are invalid.</i>	

## 4.7 Class Description: IngestWorker

A thread routine for performing ingestion into Splunk.

<b>Class Name:</b> IngestWorker	
<b>Superclass:</b> QThread	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b>	
<b>Contract:</b> 41. Ingest log file data	
Responsibilities	Collaborations
1. Ingest log file data into Splunk. <i>def run():</i> <i>Begins reading log files and sending them to Splunk for ingestion.</i> <i>Pre: Root Directory contains files to be processed (not empty)</i>	Validator 1-3, Queue 1-4

*Post: Emits finished signal. Log file cleansing, validation and ingestion status is updated accordingly.*

## 4.8 Class Description: ValidateWorker

A thread routine for validating logfiles.

<b>Class Name:</b> SplunkManager	
<b>Superclass:</b> QThread	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b>	
<b>Contract:</b> 42. Validate log file data.	
<b>Responsibilities</b>	<b>Collaborations</b>
1. Validate a log file. <i>def run():            Begins reading a log file and validating it against various criteria.            Pre: File is not empty and valid.            Post: Emits file_updated signal. Emits finished signal. Log file cleansing, validation, and ingestion status is updated accordingly.</i>	Validator 2

## 4.9 Class Description: ForceIngestWorker

A thread routine for performing forced ingestion into Splunk.

<b>Class Name:</b> ForceIngestWorker	
<b>Superclass:</b> QThread	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b>	
<b>Contract:</b> 43. Force ingest log file data.	
<b>Responsibilities</b>	<b>Collaborations</b>
1. Force ingest log file data into Splunk. <i>def run():            Begins reading a log files and sends it to Splunk for ingestion.            Pre: File is not empty.            Post: Emits file_updated signal. Log file acknowledge and ingestion status is set True.</i>	

## 5 Internal Data Store: Detailed Description

### 5.1 Component Description

The Internal Data Store subsystem is responsible for the maintenance and persistence of user-provided, configurable items. Such items can include customized event names, vector names, and any other labels or data that the system allows the user to personalize. This subsystem includes the Main, Event, Settings, Dictionary, QObject, Vector, ActiveVector, Node, Relationship, History, ProjectMerge, ExportTable, ExportGraph, FileUtil, and Queue classes.

### 5.2 Class Description: Main

Serves as an entry and exit point to the system.

<b>Class Name:</b> Main	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b>	<b>Collaborations</b>
<ul style="list-style-type: none"> <li>• Loads the event object from file.</li> <li>• Loads the settings object from file.</li> <li>• Saves the settings object to file.</li> <li>• Loads the log file IDDict from file.</li> <li>• Loads the log entry IDDict from file.</li> <li>• Saves the log file IDDict to file.</li> <li>• Saves the log entry IDDict to file.</li> <li>• Launches UI.</li> </ul>	Event 10 Settings 18 Settings 17
<b>No Contracts</b>	

### 5.3 Class Description: Event

The Event class is responsible for maintaining the information and attributes that describe the specific event for an analysis/session.

<b>Class Name:</b> Event	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> None	
<b>Contract:</b> 8. Provide event details.	
<b>Responsibilities</b>	<b>Collaborations</b>
1. Knows user-provided event name. <i>def get_name() -&gt; str:</i> <i>returns: String representing the event name.</i> <i>Retrieves the name from this event.</i> <i>Pre: None</i> <i>Post: Returned string is non-null.</i>	
2. Know user-provided event description. <i>def get_desc() -&gt; str:</i> <i>returns: String representing the event description.</i> <i>Retrieves the description from this event.</i> <i>Pre: None</i>	

<p><i>Post: Returned string is non-null.</i></p> <p>3. Knows user-provided start timestamp.  <i>def get_start_time() -&gt; QDateTime:</i>  <i>returns: QDateTime representing the start timestamp.</i>  <i>Retrieves the start timestamp from this event.</i>  <i>Pre: None</i>  <i>Post: Returned QDateTime is non-null.</i></p> <p>4. Knows user-provided end timestamp.  <i>def get_end_time() -&gt; QDateTime:</i>  <i>returns: QDateTime representing the end timestamp.</i>  <i>Retrieves the end timestamp from this event.</i>  <i>Pre: None</i>  <i>Post: Returned QDateTime is non-null.</i></p>	
<b>Contract: 9. Save event details.</b>	
<b>Responsibilities</b>	<b>Collaborations</b>
<p>5. Records user-provided event name.  <i>def set_name(name: str):</i>  <i>name: String representing the event name.</i>  <i>Sets the name of this event.</i>  <i>Pre: name is non-null.</i>  <i>Post: name is set to event's attribute name.</i></p> <p>6. Records user-provided event description.  <i>def set_desc(desc: str):</i>  <i>desc: String representing the event description.</i>  <i>Sets the description of this event.</i>  <i>Pre: desc is non-null.</i>  <i>Post: desc is set to event's attribute desc.</i></p> <p>7. Records user-provided start timestamp.  <i>def set_start_time(start: QDateTime):</i>  <i>start: QDateTime representing the start timestamp.</i>  <i>Sets the start timestamp of this event.</i>  <i>Pre: start is non-null.</i>  <i>Post: If start is set before attribute end_timestamp, start is set to attribute start_timestamp; otherwise, start_timestamp is set to end_timestamp.</i></p> <p>8. Records user-provided end timestamp.  <i>def set_end_time(end: QDateTime):</i>  <i>end: QDateTime representing the end timestamp.</i>  <i>Sets the end timestamp of this event.</i>  <i>Pre: end is non-null.</i>  <i>Post: If end is set after attribute start_timestamp, end is set to attribute end_timestamp; otherwise, end_timestamp is set to start_timestamp.</i></p>	
<b>Contract: 10. Save-load event object.</b>	
<b>Responsibilities</b>	<b>Collaborations</b>

<p>9. Saves itself to file.  <i>def save():</i>  <i>Saves this event object to a file.</i>  <i>Pre: None</i>  <i>Post: Settings object binary is written to a file in ./cache/event.pk; throws IOException.</i></p>	FileUtil 1
<p>10. Loads itself from file.  <i>def load():</i>  <i>Loads an event object from a file.</i>  <i>Pre: None</i>  <i>Post: If file './cache/event.pk' exists, settings object is initialized from the file; if file does not exist, nothing happens; throws IOException.</i></p>	FileUtil 2

## 5.4 Class Description: Settings

The Settings class is responsible for housing global variables of a given event/session.

<b>Class Name:</b> Settings				
<b>Superclass:</b> None				
<b>Subclasses:</b> None				
<b>Private Responsibilities:</b> None				
<b>Contract:</b> 11. Provide networking details.				
<b>Responsibilities</b>			<b>Collaborations</b>	
<div>1. Knows lead status check. <i>def get_lead_status() -&gt; bool:</i> <i>returns: True if the lead checkbox is checked, false otherwise.</i> <i>Checks whether the lead IP address check box is checked.</i> <i>Pre: None</i> <i>Post: Returned boolean is non-null.</i></div> <div>2. Knows lead machine IP address. <i>def get_lead_IP() -&gt; str:</i> <i>returns: String representing lead machine's IP address.</i> <i>Retrieves the recorded, lead IP address</i> <i>Pre: None</i> <i>Post: Returned string is non-null.</i></div> <div>3. Knows host machine IP address. <i>def get_host_IP () -&gt; str:</i> <i>returns: String representing the host machine's IP address.</i> <i>Retrieves the current host's IP address.</i> <i>Pre: None</i> <i>Post: Returned string is non-null.</i></div>				
<b>Contract:</b> 12. Save networking details.				
<b>Responsibilities</b>			<b>Collaborations</b>	
<div>4. Records lead status check. <i>def set_lead_status(status: bool):</i> <i>status: Boolean condition which sets the lead's status either true or false.</i></div>				
SDD	Keikaku 企画	Date	Page	
		05/09/2020	25	

<p><i>Sets the lead status for the session.</i>  <i>Pre: status is non-null.</i>  <i>Post: status is set to settings attribute lead_status.</i></p> <p>5. Records lead machine IP address.  <i>def set_lead_IP(lead_IP: str):</i>  <i>lead_IP: String representing the lead's IP address.</i>  <i>Records the IP address of the lead for a given session.</i>  <i>Pre: lead_IP is non-null.</i>  <i>Post: lead_IP is set to settings attribute lead_IP_address.</i></p> <p>6. Records host machine IP address.  <i>def set_host_IP(host_IP: str):</i>  <i>host_IP: String representing the host's IP address.</i>  <i>Sets the host machine's IP address.</i>  <i>Pre: host_IP is non-null.</i>  <i>Post: host_IP is set to settings attribute host_IP_address.</i></p>	
<b>Contract:</b> 13. Provide directory details.	
Responsibilities	Collaborations
<p>7. Knows red team directory.  <i>def get_red_directory() -&gt; str:</i>  <i>returns: String representing the red team's directory path.</i>  <i>Retrieves the red team's directory path.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>8. Knows blue team directory.  <i>def get_blue_directory() -&gt; str:</i>  <i>returns: String representing the blue team's directory path.</i>  <i>Retrieves the blue team's directory path.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>9. Knows white team directory.  <i>def get_white_directory() -&gt; str:</i>  <i>returns: String representing the white team's directory path.</i>  <i>Retrieves the white team's directory path.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>10. Knows root directory.  <i>def get_root_directory() -&gt; str:</i>  <i>returns: String representing the root directory path.</i>  <i>Retrieves the root directory's path.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>11. Knows icon directory.  <i>def get_icon_directory() -&gt; str:</i>  <i>returns: String representing the icon directory path.</i></p>	

Retrieves the icon directory's path. <i>Pre: None</i> <i>Post: Returned string is non-null.</i>			
<b>Contract: 14. Save directory details.</b>			
<b>Responsibilities</b>		<b>Collaborations</b>	
12. Records red team directory. <i>def set_red_directory(name: str):</i> <i>name: String representing the red team's directory name.</i> <i>Sets the red team's directory path.</i> <i>Pre: name is non-null.</i> <i>Post: name is set to settings attribute red_directory.</i>			
13. Records blue team directory. <i>def set_blue_directory(name: str):</i> <i>name: String representing the blue team's directory name.</i> <i>Sets the blue team's directory path.</i> <i>Pre: name is non-null.</i> <i>Post: name is set to settings attribute blue_directory.</i>			
14. Records white team directory. <i>def set_white_directory(name: str):</i> <i>name: String representing the white team's directory name.</i> <i>Sets the white team's directory path.</i> <i>Pre: name is non-null.</i> <i>Post: name is set to settings attribute white_directory.</i>			
15. Records root directory. <i>def set_root_directory(name: str):</i> <i>name: String representing the root directory name.</i> <i>Sets the root team's directory path.</i> <i>Pre: name is non-null.</i> <i>Post: name is set to settings attribute root_directory.</i>			
16. Records icon directory. <i>def set_icon_directory(name: str):</i> <i>name: String representing the icon directory name.</i> <i>Sets the icon team's directory path.</i> <i>Pre: name is non-null.</i> <i>Post: name is set to settings attribute icon_directory.</i>			
<b>Contract: 15. Save-load settings object.</b>			
<b>Responsibilities</b>		<b>Collaborations</b>	
17. Saves itself to file. <i>def save():</i> <i>Saves this settings object to a file.</i> <i>Pre: None</i> <i>Post: Settings object binary is written to a file in</i> <i>./cache/settings.pk; throws IOException.</i>		FileUtil 1	
18. Loads itself from file. <i>def load():</i>		FileUtil 2	
SDD	Keikaku 企画	Date 05/09/2020	Page 27

<i>Loads a settings object from a file.</i> <i>Pre: None</i> <i>Post: If file './cache/settings.pk' exists, settings object is initialized from the file; if file does not exist, nothing happens; throws IOException.</i>	
--	--

## 5.5 Class Description: IDDict

The IDDict class is responsible for storing a map of generic objects and their unique id.

<b>Class Name:</b> IDDict	
<b>Superclass:</b> QObject	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> <ul style="list-style-type: none"> <li>Maps a generated uid for each entry.</li> </ul>	
<b>Contract:</b> 16. Modify dictionary.	
Responsibilities	Collaborations
<p>1. Adds an entry to the dictionary.  <i>def add(obj: Any):</i>  <i>obj: an object to insert.</i>  <i>Adds new object to dictionary.</i>  <i>Pre: object is non-null.</i>  <i>Post: A new object has been inserted into dictionary.</i>  <i>Add signal is emitted.</i></p> <p>2. Removes an entry from the dictionary.  <i>def delete(uid: str):</i>  <i>uid: the unique id of the object.</i>  <i>Removes the object provided the uid.</i>  <i>Pre: uid exists in dictionary.</i>  <i>Post: Object is no longer in dictionary.</i>  <i>Delete signal is emitted.</i></p> <p>3. Retrieves an entry from the dictionary.  <i>def get(uid: str) -&gt; Any:</i>  <i>uid: the unique id of the object.</i>  <i>returns: Object of the associated uid.</i>  <i>Retrieves object given uid.</i>  <i>Pre: uid exists in dictionary.</i>  <i>Post: Returned object is non-null.</i></p> <p>4. Retrieves all entries from the dictionary.  <i>def items() -&gt; list:</i>  <i>returns: List of key-value pair tuples (str: Any).</i>  <i>Retrieves all the items in the dictionary.</i>  <i>Pre: None.</i>  <i>Post: Returned list is non-null.</i></p>	

## 5.6 Class Description: Vector

The vector class is responsible for storing the data of nodes and relationships that compose a vector.

<b>Class Name:</b> Vector			
<b>Superclass:</b> None			
<b>Subclasses:</b> None			
<b>Private Responsibilities:</b> None			
<b>Contract:</b> 18. Provide vector details.			
<b>Responsibilities</b>		<b>Collaborations</b>	
<div>1. Knows vector name. <i>def get_name() -&gt; str:</i> <i>returns: String representing the vector name.</i> <i>Retrieves the name from this vector.</i> <i>Pre: None</i> <i>Post: Returned string is non-null.</i></div> <div>2. Knows vector description. <i>def get_desc() -&gt; str:</i> <i>returns: String representing the vector description.</i> <i>Retrieves the description from this vector.</i> <i>Pre: None</i> <i>Post: Returned string is non-null.</i></div> <div>3. Knows node id property visibility flag. <i>def get_node_id_visibility() -&gt; bool:</i> <i>returns: True if set, false otherwise.</i> <i>Determines if node id visibility is set.</i> <i>Pre: None</i> <i>Post: Returned value is either True or False.</i></div> <div>4. Know node name property visibility flag. <i>def get_node_name_visibility() -&gt; bool:</i> <i>returns: True if set, false otherwise.</i> <i>Determines if node name visibility is set.</i> <i>Pre: None</i> <i>Post: Returned value is either True or False.</i></div> <div>5. Knows node timestamp property visibility lag. <i>def get_node_time_visibility() -&gt; bool:</i> <i>returns: True if set, false otherwise.</i> <i>Determines if node timestamp visibility is set.</i> <i>Pre: None</i> <i>Post: Returned value is either True or False.</i></div> <div>6. Knows node description property visibility flag. <i>def get_node_desc_visibility() -&gt; bool:</i> <i>returns: True if set, false otherwise.</i> <i>Determines if node description visibility is set.</i> <i>Pre: None</i> <i>Post: Returned value is either True or False.</i></div>			
SDD	Keikaku 企画	Date 05/09/2020	Page 29

<p>7. Knows node log entry reference property visibility flag.  <code>def get_log_entry_visibility() -&gt; bool:</code>  <i>returns: True if set, false otherwise.</i>  <i>Determines if log entry reference visibility is set.</i>  <i>Pre: None</i>  <i>Post: Returned value is either True or False.</i></p> <p>8. Knows node log creator property visibility flag.  <code>def get_log_creator_visibility() -&gt; bool:</code>  <i>returns: True if set, false otherwise.</i>  <i>Determines if log creator visibility is set.</i>  <i>Pre: None</i>  <i>Post: Returned boolean value in non-null.</i></p> <p>9. Knows node event type property visibility flag.  <code>def get_event_type_visibility() -&gt; bool:</code>  <i>returns: True if set, false otherwise.</i>  <i>Determines if event type visibility is set.</i>  <i>Pre: None</i>  <i>Post: Returned value is either True or False.</i></p> <p>10. Knows node icon type property visibility flag.  <code>def get_icon_type_visibility() -&gt; bool:</code>  <i>returns: True if set, false otherwise.</i>  <i>Determines if icon type visibility is set.</i>  <i>Pre: None</i>  <i>Post: Returned value is either True or False.</i></p> <p>11. Knows node source property visibility flag.  <code>def get_source_visibility() -&gt; bool:</code>  <i>returns: True if set, false otherwise.</i>  <i>Determines if source visibility is set.</i>  <i>Pre: None</i>  <i>Post: Returned value is either True or False.</i></p>	
<b>Contract:</b> 19. Save vector details.	
<b>Responsibilities</b>	<b>Collaborations</b>
<p>12. Records vector name.  <code>def set_name(name: str):</code>  <i>name: String representing the vector name.</i>  <i>Sets the name of this vector.</i>  <i>Pre: name is non-null.</i>  <i>Post: name is set to vector attribute name.</i></p> <p>13. Records vector description.  <code>def set_desc(desc: str):</code>  <i>name: String representing the vector description.</i>  <i>Sets the description of this vector.</i>  <i>Pre: desc is non-null.</i>  <i>Post: desc is set to vector attribute description.</i></p>	

14. Records node id property visibility flag.

*def toggle\_node\_id\_visibility() -> bool:*

*Toggles the node id visibility.*

*Pre: None*

*Post: Property visibility is updated.*

*Property signal updated is emitted.*

15. Records node name property visibility flag.

*def toggle\_node\_name\_visibility():*

*Toggles the node name visibility.*

*Pre: None*

*Post: Property visibility is updated.*

*Property signal updated is emitted.*

16. Records node timestamp property visibility lag.

*def toggle\_node\_time\_visibility() -> bool:*

*Toggles the node timestamp visibility.*

*Pre: None*

*Post: Property visibility is updated.*

*Property updated signal is emitted.*

17. Records node description property visibility flag.

*def toggle\_node\_desc\_visibility() -> bool:*

*Toggles the node description visibility.*

*Pre: None*

*Post: Property visibility is updated.*

*Property updated signal is emitted.*

18. Records node log entry reference property visibility flag.

*def toggle\_log\_entry\_visibility()*

*Toggles the log entry visibility.*

*Pre: None*

*Post: Property visibility is updated.*

*Property updated signal is emitted.*

19. Records node log creator property visibility flag.

*def toggle\_log\_creator\_visibility()*

*Toggles the log creator visibility.*

*Pre: None*

*Post: Property visibility is updated.*

*Property updated signal is emitted.*

20. Records node event type property visibility flag.

*def toggle\_event\_type\_visibility():*

*Toggles the event type visibility.*

*Pre: None*

*Post: Property visibility is updated.*

*Property updated signal is emitted.*

21. Records node icon type property visibility flag.

<pre>def toggle_icon_type_visibility():     Toggles the icon type visibility.     Pre: None     Post: Property visibility is updated.         Property updated signal is emitted.</pre> <p>22. Records node source property visibility flag.</p> <pre>def toggle_source_visibility():     Toggles the source visibility.     Pre: None     Post: Property visibility is updated.         Property updated signal is emitted.</pre>	
<b>Contract: 20. Modify node dictionary.</b>	
Responsibilities	Collaborations
<p>23. Add node to dictionary.</p> <pre>def add_node() -&gt; str:     returns: String representing the node's uid.     Adds a new node to the dictionary.     Pre: None     Post: Returned string is non-null.         Dictionary contains a new node.</pre> <p>24. Remove node from dictionary.</p> <pre>def delete_node(node_id: str):     node_id: String representing the node's uid.     Removes a node corresponding to node_id from the     dictionary.     Pre: node_id exists in the dictionary.     Post: Node with node_id is no longer in the dictionary.</pre> <p>25. Retrieve node form dictionary.</p> <pre>def get_node(node_id: str) -&gt; Node     returns: Node object corresponding to node_id.     node_id: String representing the node's uid.     Retrieves a node corresponding to node_id from the     dictionary.     Pre: Node id exists in the dictionary.     Post: Returned Node is non-null.</pre> <p>26. Retrieve all nodes from dictionary.</p> <pre>def node_items() -&gt; List:     returns: List of key-value tuples (str: Node).     Retrieves all nodes from the dictionary.     Pre: None     Post: Returned list is non-null.</pre>	<p>IDDict 1</p> <p>IDDict 2</p> <p>IDDict 3</p> <p>IDDict 4</p>
<b>Contract: 21. Modify relationship dictionary.</b>	
Responsibilities	Collaborations
<p>27. Add relationship to dictionary.</p> <pre>def add_relationship() -&gt; str:     returns: String representing the relationship's uid.</pre>	<p>IDDict 1</p>

<p>Adds a new relationship to the dictionary.  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i>  <i>Dictionary contains a new relationship.</i></p>	
<p>28. Remove relationship from dictionary.  <i>def delete_relationship(relationship_id: str):</i>  <i>relationship_id: String representing the relationship's uid.</i>  <i>Removes relationship from the dictionary.</i>  <i>Pre: relationship_id exists in the dictionary.</i>  <i>Post: Relationship with relationship_id is no longer in the dictionary.</i></p>	IDDict 2
<p>29. Retrieve relationship from dictionary.  <i>def get_relationship(relationship_id: str) -&gt; Relationship</i>  <i>returns: Relationship object corresponding with relationship_id.</i>  <i>relationship_id: String representing the relationship's uid.</i>  <i>Retrieves a relationship corresponding to relationship_id from the dictionary.</i>  <i>Pre: relationship_id exists in the dictionary.</i>  <i>Post: Returned Relationship is non-null.</i></p>	IDDict 3
<p>30. Retrieve all relationships from dictionary.  <i>def relationship_items() -&gt; List:</i>  <i>returns: list of key-value tuples (relationship id: relationship).</i>  <i>Retrieves all relationships from the dictionary.</i>  <i>Pre: None</i>  <i>Post: Returned List non-null.</i></p>	IDDict 4

## 5.7 Class Description: ActiveVector

The ActiveVector class is responsible for storing the currently selected vector and its unique id.

<b>Class Name:</b> ActiveVector	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> None	
<b>Contract:</b> 22. Provide active vector details.	
Responsibilities	Collaborations
<p>1. Knows active vector.  <i>def get_vector() -&gt; Vector:</i>  <i>returns: Vector of currently selected (active) vector.</i>  <i>Retrieves the ActiveVector.</i>  <i>Pre: None</i>  <i>Post: Returned object is a vector if non-null.</i></p> <p>2. Knows active vector id.  <i>def get_uid() -&gt; str:</i>  <i>returns: String representing the Active Vector id.</i>  <i>Retrieves the uid from the Active Vector.</i></p>	

<i>Pre: None</i> <i>Post: Returned string is non-null.</i>	
<b>Contract:</b> 23. Save active vector details.	
<b>Responsibilities</b>	<b>Collaborations</b>
3. Records active vector. <i>def set_vector(vector: Vector):</i> <i>vector: Vector to be set as active.</i> <i>Sets the active vector.</i> <i>Pre: vector is non-null.</i> <i>Post: vector is set to ActiveVector attribute vector.</i>	
4. Records active vector id. <i>def set_uid(uid: str):</i> <i>name: String representing the ActiveVector id.</i> <i>Sets the ActiveVector id.</i> <i>Pre: uid is non-null.</i> <i>Post: uid is set to ActiveVector attribute vector_id.</i>	

## 5.8 Class Description: Node

The Node class is responsible for the storage of log entry properties.

<b>Class Name:</b> Node	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> None	
<b>Contract:</b> 24. Provide node details.	
<b>Responsibilities</b>	<b>Collaborations</b>
1. Knows node name. <i>def get_name() -&gt; str:</i> <i>returns: String representing the node name.</i> <i>Retrieves the name from this node.</i> <i>Pre: None</i> <i>Post: Returned string is non-null.</i>	
2. Knows node timestamp. <i>def get_timestamp() -&gt; QDateTime:</i> <i>returns: QDateTime representing the node's timestamp.</i> <i>Retrieves the timestamp from this node.</i> <i>Pre: None</i> <i>Post: Returned QDateTime is non-null.</i>	
3. Knows node description. <i>def get_description() -&gt; str:</i> <i>returns: String representing the node description.</i> <i>Retrieves the description from this node.</i> <i>Pre: None</i> <i>Post: Returned string is non-null.</i>	
4. Knows node log entry reference. <i>def get_log_entry() -&gt; str:</i> <i>returns: String representing the log entry reference.</i>	

<p><i>Retrieves the log_entry from this node.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>5. Knows node log creator.  <i>def get_log_creator() -&gt; str:</i>  <i>returns: String representing the person that created the log.</i>  <i>Retrieves the log_creator from this node.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>6. Knows node event type.  <i>def get_event_type() -&gt; str:</i>  <i>returns: String representing the event type.</i>  <i>Retrieves the event_type from this node.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>7. Knows node icon type.  <i>def get_icon_type() -&gt; str:</i>  <i>returns: String representing the type of icon the node will use.</i>  <i>Retrieves the icon_type from this node.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>8. Knows node source filename.  <i>def get_source_file_name() -&gt; str:</i>  <i>returns: String representing the source file name.</i>  <i>Retrieves the source_file_name from this event.</i>  <i>Pre: None</i>  <i>Post: Returned string is non-null.</i></p> <p>9. Knows node visibility.  <i>def get_visibility() -&gt; bool:</i>  <i>returns: Boolean representing the node visibility.</i>  <i>Retrieves whether this node shall be visible or not.</i>  <i>Pre: None</i>  <i>Post: Returned value is either True or False.</i></p> <p>10. Knows node coordinate position.  <i>def get_coordinate_position() -&gt; List:</i>  <i>returns: Integer list representing the position of the node on the graph view.</i>  <i>Retrieves the coordinate position from this node.</i>  <i>Pre: None</i>  <i>Post: Returned List is exactly 2 integers.</i></p>	
<b>Contract:</b> 25. Save node details.	
<b>Responsibilities</b>	<b>Collaborations</b>
11. Records node name.	

*def set\_name(name: str):*  
*name: String representing the node name.*  
*Sets the name of this node.*  
*Pre: name is non-null.*  
*Post: name attribute is set to the given string.*

12. Records node timestamp.  
*def set\_timestamp(timestamp: QDateTime):*  
*timestamp: datetime representing the node's time.*  
*Sets the timestamp of this node.*  
*Pre: timestamp is non-null.*  
*Post: timestamp attribute is set to the given QDateTime.*

13. Records node description.  
*def set\_description(description: str):*  
*description: String representing the node's description.*  
*Sets the description of this node.*  
*Pre: description is non-null.*  
*Post: description attribute is set to the given string.*

14. Records node log entry reference.  
*def set\_log\_entry\_reference(log\_entry\_reference: str):*  
*log\_entry\_reference: String representing the node's log entry reference.*  
*Sets the log\_entry\_reference of this node.*  
*Pre: log\_entry\_reference is non-null.*  
*Post: log\_entry\_reference attribute is set to the given string.*

15. Records node log creator.  
*def set\_log\_creator(log\_creator: str):*  
*log\_creator: String representing the node's log creator.*  
*Sets the log\_creator of this node.*  
*Pre: log\_creator is non-null.*  
*Post: log\_creator attribute is set to given string.*

16. Records node event type.  
*def set\_event\_type(event\_type: str):*  
*event\_type: String representing the node's event type.*  
*Sets the event\_type of this node.*  
*Pre: event\_type is non-null.*  
*Post: event\_type attribute is set to the given string.*

17. Records node icon type.  
*def set\_icon\_type(icon\_type: str):*  
*icon\_type: String representing the node's icon type.*  
*Sets the icon\_type of this event.*  
*Pre: icon\_type is non-null.*  
*Post: icon\_type attribute is set to the given string.*

18. Records node source filename.  
*def set\_filename(filename: str):*

<p><i>filename</i>: String representing the node's filename.  Sets the filename of this event.  <i>Pre</i>: filename is non-null.  <i>Post</i>: filename is set to settings attribute name.</p> <p>19. Records node visibility.  <i>def set_visibility(name: bool):</i>  <i>name</i>: Bool representing the node's visibility.  Sets the visibility of this node.  <i>Pre</i>: visibility is non-null.  <i>Post</i>: visibility attribute is set to the given boolean.</p> <p>20. Records node coordinate position.  <i>def set_coordinate_position(coordinate_postition: List):</i>  <i>coordinate_postition</i>: Integer list representing the coordinate position of the node in the graph view.  Sets the coordinate_postition of this event.  <i>Pre</i>: coordinate_postition is non-null.  <i>Post</i>: coordinate_postition attribute is set to the given list.</p>	
---	--

## 5.9 Class Description: Relationship

The Relationship class is responsible for storing the child and parent node IDs that constitute a given relationship in the system.

<b>Class Name:</b> Relationship	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> None	
<b>Contract:</b> 26. Provide parent-child node relationship details.	
Responsibilities	Collaborations
<p>1. Knows parent node identification number.  <i>def get_parent() -&gt; str:</i>  <i>returns</i>: String representing the parent node uid.  Retrieves the uid from the parent Node.  <i>Pre</i>: None  <i>Post</i>: Returned string is non-null.</p> <p>2. Knows child node identification number.  <i>def get_child() -&gt; str:</i>  <i>returns</i>: String representing the child node uid.  Retrieves the uid from the child Node.  <i>Pre</i>: None  <i>Post</i>: Returned string is non-null.</p> <p>3. Knows relationship label.  <i>def get_label() -&gt; str:</i>  <i>returns</i>: String representing the relationship label.  Retrieves the name of the relationship label.  <i>Pre</i>: None  <i>Post</i>: Returned string is non-null.</p>	

<p>4. Knows relationship line coordinates.  <i>def get_coordinates() -&gt; List:</i>  <i>returns: Integer list representing the endpoints of the relationship line.</i>  <i>Retrieves a list of integers for relationship's line endpoints.</i>  <i>Pre: None</i>  <i>Post: Returned List is exactly 2 integers.</i></p>	
<b>Contract:</b> 27. Save parent-child node relationship details.	
<b>Responsibilities</b>	<b>Collaborations</b>
<p>5. Records parent node identification number.  <i>def set_parent(parent: str):</i>  <i>parent: String representing the parent node of the relationship.</i>  <i>Sets the string of the parent.</i>  <i>Pre: parent is non-null.</i>  <i>Post: parent attribute is set to the given string.</i></p> <p>6. Records child node identification number.  <i>def set_child(child: str):</i>  <i>child: String representing the child node of the relationship.</i>  <i>Sets the string of the child.</i>  <i>Pre: child is non-null.</i>  <i>Post: child attribute is set to the given string.</i></p> <p>7. Records relationship label.  <i>def set_label(label: str):</i>  <i>label: String representing the relationship label.</i>  <i>Sets the name of this event.</i>  <i>Pre: label is non-null.</i>  <i>Post: label attribute is set to the given string.</i></p> <p>8. Records relationship line coordinates.  <i>def set_coordinates(coordinates: List):</i>  <i>coordinates: Integer list representing the endpoints of the relationship line.</i>  <i>Sets the integer list of this relationship.</i>  <i>Pre: coordinates is non-null.</i>  <i>Post: coordinates attribute is set to the given integer list.</i></p>	

## 5.10 Class Description: History

The History class is responsible for storing the vectors', nodes' and relationships' history of changes and saving them.

<b>Class Name:</b> History			
<b>Superclass:</b> None			
<b>Subclasses:</b> None			
<b>Private Responsibilities:</b> None			
<b>Contract:</b> 28. Display history of changes.			
<b>Responsibilities</b>		<b>Collaborations</b>	
1. Displays changes to vector, node, and relationship tables.		IDDict 4; Vector 1-11, 26, 30; Node 1-10; Relationship 1-4	
<b>SDD</b>	<b>Keikaku 企画</b>	<b>Date</b> 05/09/2020	<b>Page</b> 38

<i>def get_changes() -&gt; List:</i> <i>returns: A list which outlines the most recent changes to the vector, node, or relationship tables.</i> <i>Retrieves the detailed changes to either vector, node or relationship table.</i> <i>Pre: None</i> <i>Post: Returned list is non-null.</i>	
<b>Contract:</b> 29. Save changes.	
<b>Responsibilities</b>	<b>Collaborations</b>
2. Saves changes made to vector, node, and relationship tables. <i>def set_changes(changes: List):</i> <i>changes: List consisting of formatted message with changes to vector, node, or relationship tables.</i> <i>Pre: changes list is non-null.</i> <i>Post: Most recent change attribute is updated with changes list.</i>	FileUtil 1

## 5.11 Class Description: ProjectMerge

The ProjectMerge class is responsible for the merging of analyst and lead history changes.

<b>Class Name:</b> ProjectMerge	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> None	
<b>Contract:</b> 30. Merge data.	
<b>Responsibilities</b>	<b>Collaborations</b>
1. Merges vector, node, and relationship data with stored vector, node, and relationship data. <i>def merge_data():</i> <i>Syncs retrieved data with database data.</i> <i>Pre: Data store must be established.</i> <i>Post: Data store is updated with retrieved data.</i>	Vector 1-22, 26, 30; Node 1-20; Relationship 1-8 History 1-2

## 5.12 Class Description: Sync

The Sync class is responsible for handling data transferal from lead and client.

<b>Class Name:</b> Sync	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> None	
<b>Contract:</b> 31. Provides push/pull request changes.	
<b>Responsibilities</b>	<b>Collaborations</b>
1. Pushes client changes to lead. <i>def push_client_changes(changes: List):</i> <i>changes: List of client's local changes.</i> <i>Provides detailed list to lead of client's local changes.</i> <i>Pre: List is non-null.</i> <i>Post: Lead now has new merge changes to accept/decline to push to DB.</i>	Settings 3
2. Pulls lead changes to client. <i>def pull_client_changes() -&gt; List:</i> <i>returns: List providing itemized client changes.</i> <i>Pulls lead changes to client's local data store.</i> <i>Pre: None</i> <i>Post: Returned list is non-null.</i>	Settings 3
<b>Contract:</b> 32. Modify push request queue.	
<b>Responsibilities</b>	<b>Collaborations</b>
3. Queues push requests from clients. <i>def enqueue_push_request(push_request: List):</i> <i>push_request: A list that describes the various changes being pushed to the DB.</i> <i>Adds the push_request list to the end of the queue.</i> <i>Pre: push_request is non-null.</i> <i>Post: Client push request has been enqueued in chronological order.</i>	
4. Removes push request from queue. <i>def pop_push_request() -&gt; List:</i> <i>returns: List of the analyst changes that need to be pushed to DB.</i> <i>Provides the list of changes that need to be performed prior to sending changes to DB.</i> <i>Pre: None</i> <i>Post: Returned List is non-null.</i>	

## 5.13 Class Description: ExportTable

The ExportTable class is responsible for the formatting of the log entry tables that compose the vectors of a given event into an exportable file.

<b>Class Name:</b> ExportTable			
<b>Superclass:</b> None			
<b>Subclasses:</b> None			
<b>Private Responsibilities:</b> None			
<b>SDD</b>	<b>Keikaku 企画</b>	<b>Date</b> 05/09/2020	<b>Page</b> 40

<b>Contract:</b> 33. Save tables to file.	
<b>Responsibilities</b>	<b>Collaborations</b>
1. Compiles the vector, node and relationship tables into a single, exportable file. <i>def table_export_file(file: str):</i> <i>file: String representing the filename and path in which to export to.</i> <i>Provides a single exportable file for the vector, node, and relationship tables.</i> <i>Pre: Tables must have information.</i> <i>Post: File is created and saved at the file path.</i>	Vector 1-2, 26, 30; Node 1-9; Relationship 1-3

### 5.14 Class Description: ExportGraph

The ExportGraph class is responsible for the formatting of the final graph with its corresponding vector into an exportable image file.

<b>Class Name:</b> ExportGraph	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> None	
<b>Contract:</b> 34. Save graph to image file.	
<b>Responsibilities</b>	<b>Collaborations</b>
1. Renders an exportable image file of the Graph. <i>def export_graph(vector: Vector, file: str):</i> <i>file: String representing the filename and path in which to export to.</i> <i>vector: The vector whose graph is to be rendered.</i> <i>Returns an image file of the vector's graph.</i> <i>Pre: Graph must be rendered.</i> <i>Post: File is created and saved at the file path.</i>	Graph 5-6

### 5.15 Class Description: FileUtil

A set of subroutines related to file processing.

<b>Class Name:</b> FileUtil	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> None	
<b>Contract:</b> 38. Save object to file.	
<b>Responsibilities</b>	<b>Collaborations</b>
1. Saves an object to a file. <i>def save_object(obj: Any, filename: str):</i> <i>obj: Python object to save to file.</i> <i>filename: Name of the file to save the object to.</i> <i>Saves an object to a file.</i> <i>Pre: Filename must be a non-empty string.</i> <i>Post: File is created and saved in the cache directory.</i>	
<b>Contract:</b> 39. Read object from file.	
<b>Responsibilities</b>	<b>Collaborations</b>
2. Reads an object from a file. <i>def read_file(filename: str) -&gt; Any:</i>	

<i>filename: Name of the file to read the object from.</i> <i>Reads an object from a file.</i> <i>Pre: Filename must be a non-empty string.</i> <i>Post: The object from the file is reconstructed as a python object.</i>	
---	--

## 5.16 Class Description: Queue

A simple queue implementation.

<b>Class Name:</b> Queue	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> None	
<b>Contract:</b> 40. Provide queue functionality.	
Responsibilities	Collaborations
<ol style="list-style-type: none"> <li>1. Determine if queue is empty.  <i>def is_empty() -&gt; bool:</i>  <i>Determines if queue is empty.</i>  <i>Pre: None</i>  <i>Post: Returned value is True is empty, False otherwise.</i> </li> <li>2. Enqueue an item.  <i>def enqueue(item: Any) -&gt; bool:</i>  <i>item: An object to insert into the queue.</i>  <i>Inserts an item to the queue.</i>  <i>Pre: None</i>  <i>Post: Object provided has been put at the front of the queue.</i> </li> <li>3. Dequeue an item.  <i>def dequeue() -&gt; bool:</i>  <i>Removes and retrieves an item from the queue.</i>  <i>Pre: None</i>  <i>Post: The object returned is the oldest in the queue.</i> </li> <li>4. Determines the size of the queue.  <i>def size() -&gt; int:</i>  <i>Returns the size of the queue.</i>  <i>Pre: None</i>  <i>Post: Returned value is the number of items in the queue.</i> </li> </ol>	

## 6 Graph: Detailed Description

### 6.1 Component Description

The Graph subsystem is responsible for the displaying and the manipulation of the node and relationship data found within a vector. This subsystem includes the GraphEditor, GraphEditorScene, GraphEditorView, NodeItem, RelationshipItem, and VectorItemGroup classes.

### 6.2 Class Description: GraphEditor

The GraphEditor class is responsible for handling interactions from the rest of the UI.

<b>Class Name:</b> GraphEditor	
<b>Superclass:</b> None	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> <ul style="list-style-type: none"> <li>Toggle vector visibility</li> </ul>	
<b>Contract:</b> 35. Add/remove/edit items from the view	
Responsibilities	Collaborations
1. Add vector to the view <i>add_vector(vector: Vector)</i> <i>vector: Vector containing table information to be toggled and displayed.</i> <i>Takes a Vector to create a VectorItemGroup and adds it to the GraphEditorScene.</i> <i>Pre: A GraphEditorScene must be initialized.</i> <i>Post: A blank vector is displayed on the GraphEditorView.</i>	GraphEditorScene 1
2. Add node to the view <i>add_node(node: Node):</i> <i>node: Node containing table information to be added and displayed.</i> <i>Takes a Node to create a NodeItem and adds it to the GraphEditorScene.</i> <i>Pre: A GraphEditorScene must be initialized.</i> <i>Post: A new node is displayed on the GraphEditorView.</i>	GraphEditorScene 1 VectorItemGroup 1
3. Add relationship to the view <i>add_relationship(relationship: Relationship)</i> <i>relationship: Relationship containing table information to be added and displayed.</i> <i>Takes a Relationship to create a RelationshipItem and adds it to the GraphEditorScene.</i> <i>Pre: A GraphEditorScene must be initialized.</i> <i>Post: A new relationship is displayed on the GraphEditorView.</i>	GraphEditorScene 1 VectorItemGroup 1
4. Remove vector from the view <i>remove_vector(vector: Vector)</i> <i>vector: Vector containing table information to be removed.</i>	GraphEditorScene 2

<p><i>Takes a Vector to remove its related VectorItemGroup from the GraphEditorScene.</i>  <i>Pre: A VectorItemGroup must have been created from the given Vector.</i>  <i>Post: The GraphEditorView no longer displays the removed VectorItemGroup.</i></p> <p>5. Remove node from the view  <i>remove_node(node: Node)</i>  <i>node: Node containing table information to be removed.</i>  <i>Takes a Node to remove its related NodeItem from the GraphEditorScene.</i>  <i>Pre: A NodeItem must have been created from the given Node.</i>  <i>Post: The GraphEditorView no longer displays the removed NodeItem.</i></p> <p>6. Remove relationship from the view.  <i>remove_relationship(relationship: Relationship)</i>  <i>relationship: Relationship containing table information to be removed.</i>  <i>Takes a Relationship to remove its related RelationshipItem from the GraphEditorScene.</i>  <i>Pre: A RelationshipItem must have been created from the given Relationship.</i>  <i>Post: The GraphEditorView no longer displays the removed RelationshipItem.</i></p> <p>7. Change NodeItem text.  <i>change_node_text(node: Node):</i>  <i>node: the node whose NoteItem text needs to be updated.</i>  <i>Takes a Node and find the related NodeItem to change its text.</i>  <i>Pre: a QGraphicsSimpleTextItem must have been initialized.</i>  <i>Post: The view displays the new text for this node item</i></p> <p>8. Change RelationshipItem text.  <i>change_relationship_text(relationship: Relationship):</i>  <i>relationship: the Relationship whose RelationshipItem text needs to be updated.</i>  <i>Takes a Relationship and find the related RelationshipItem to change its text.</i>  <i>Pre: a QGraphicsSimpleTextItem must have been initialized.</i>  <i>Post: The view displays the new text for this node item</i></p>	<p>GraphEditorScene 2 VectorItemGroup 2</p> <p>GraphEditorScene 2 VectorItemGroup 2</p> <p>NodeItem 1</p> <p>RelationshipItem 2</p>
<b>Contract:</b> 36. Toggle and display vector items	
<b>Responsibilities</b>	<b>Collaborations</b>
<p>1. Display a vector  <i>def display_vector(vector: Vector)</i>  <i>vector: Vector to display.</i>  <i>Handles what vector item group should be displayed.</i></p>	VectorItemGroup 3, 4

*Pre: vector is non-null*

*Post: selected vector item group is set to vector and visibility is set.*

### 6.3 Class Description: GraphEditorScene

The GraphEditorScene class is responsible for acting as a drawing surface to all objects to the panel.

<b>Class Name:</b> GraphEditorScene	
<b>Superclass:</b> QGraphicsScene	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b>	
<ul style="list-style-type: none"> <li>Draw Graphics scene background.</li> </ul>	
<b>Contract:</b> 37. Add/remove items to the surface and ready for rendering.	
Responsibilities	Collaborations
<ol style="list-style-type: none"> <li>Add items to the surface.  <i>super().addItem(item: QGraphicsItem):</i>  <i>param item: QGraphicsItem base class for all graphical items in a QGraphicsScene.</i>  <i>Adds or moves the item and all its children to this scene. This scene takes ownership of the item.</i>  <i>Pre: This scene must have been added to a GraphEditorView</i>  <i>Post: The added item is sent to the view to render.</i> </li> <li>Add items to the surface.  <i>super().removeItem(item: QGraphicsItem):</i>  <i>param item: QGraphicsItem base class for all graphical items in a QGraphicsScene.</i>  <i>Removes the item and all its children from the scene.</i>  <i>Pre: This scene must have been added to a GraphEditorView</i>  <i>Post: The removed item is no longer rendered in the view.</i> </li> </ol>	

### 6.4 Class Description: GraphEditorView

The GraphEditorView class is responsible for rendering items and handling user events upon the panel.

<b>Class Name:</b> GraphEditorView
<b>Superclass:</b> QGraphicsView
<b>Subclasses:</b> None
<b>Private Responsibilities:</b>
<ul style="list-style-type: none"> <li>Zooms in and out of the graphical view.</li> <li>Moves nodes on graph.</li> <li>Moves relationships on graph.</li> </ul>
<b>No Contracts</b>

### 6.5 Class Description: NodeItem

The NodeItem class is responsible for a node representation upon the panel.

<b>Class Name:</b> NodeItem			
SDD	Keikaku 企画	Date	Page
		05/09/2020	45

<b>Superclass:</b> QGraphicsItem	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> <ul style="list-style-type: none"> <li>• Get the bounding rectangle.</li> <li>• Paint node to view.</li> </ul>	
<b>Contract:</b> 44. Handle changes in text and position.	
Responsibilities	Collaborations
<ol style="list-style-type: none"> <li>1. Change displaying text  <i>change_text(text : str):</i>  <i>text: Text to display.</i>  <i>Takes a string and changes the text of the QGraphicsSimpleTextItem to the given string.</i>  <i>Pre: a QGraphicsSimpleTextItem must have been initialized.</i>  <i>Post: The view displays the new text for this node item.</i> </li> <li>2. Get center graphical position of the NodeItem  <i>center_pos() -&gt; QPoint:</i>  <i>Grabs the initial bounding rectangle of this node and translates the current position of the mid point.</i>  <i>Return: a QPoint containing the center coordinated for this node.</i>  <i>Pre: The node item contains a QRectF.</i>  <i>Post: The QPoint is used to get the coordinates of the connecting relationship item.</i> </li> <li>3. Handles the mouse drag event  <i>def mouseMoveEvent(event: QGraphicsSceneMouseEvent)</i>  <i>event: for when a node is clicked and moved.</i>  <i>Used to update the relationship lines when a node is moved.</i>  <i>Pre: Relationships lines are present on graph.</i>  <i>Post: Relationship coordinates are moved to new location.</i> </li> </ol>	RelationshipItem 1

## 6.6 Class Description: RelationshipItem

The RelationshipItem class is responsible for a relationship representation upon the panel.

<b>Class Name:</b> RelationshipItem	
<b>Superclass:</b> QGraphicsLineItem	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> Paint relationship to view.	
<b>Contract:</b> 45. Dynamically display relationship line with parent and child nodes.	
Responsibilities	Collaborations
<ol style="list-style-type: none"> <li>1. Drags relationship line with either parent or child NodeItem  <i>def dragLine()</i>  <i>Used to drag this RelationsItem's line with the new NodeItem's position.</i>  <i>Pre: Relationships between nodes are specified.</i>  <i>Post: A new line is drawn between nodes to represent their new position.</i> </li> </ol>	NodeItem 2

<p>2. Change displaying text  <i>change_text(text : str):</i>  <i>text: Text to display.</i>  <i>Takes a string and changes the text of the QGraphicsSimpleTextItem to the given string.</i>  <i>Pre: a QGraphicsSimpleTextItem must have been initialized.</i>  <i>Post: The view displays the new text for this node item.</i></p>	
--	--

## 6.7 Class Description: VectorItemGroup

The VectorItemGroup class is responsible for handling a group of vector representations and switching between each to display to the panel.

<b>Class Name:</b> VectorItemGroup	
<b>Superclass:</b> QGraphicsItemGroup	
<b>Subclasses:</b> None	
<b>Private Responsibilities:</b> None	
<b>Contract:</b> 46. Handle addition, removal and visibility of vectors.	
Responsibilities	Collaborations
<p>1. Adds a graphics item to a dictionary.  <i>def add_to_list(uid: str. Item: QGraphicsItem):</i>  <i>param uid: the unique id of an item.</i>  <i>param: a QGraphicsItem to add.</i>  <i>Adds a QGraphicsItem to item dictionary provided its uid.</i>  <i>Pre: None</i>  <i>Post: QGraphicsItem is added to dictionary.</i></p> <p>2. Removes a graphics item from a dictionary.  <i>def remove_from_list(uid: str. Item)</i>  <i>param uid: the unique id of an item.</i>  <i>Removes a QGraphicsItem from an item dictionary provided its uid.</i>  <i>Pre: uid is valid and non-null.</i>  <i>Post: QGraphics item with uid is removed from dictionary.</i></p> <p>3. Graphics items are grouped together.  <i>def lock_hide()</i>  <i>adds all the items to vector item to a group.</i>  <i>Pre: GraphicsItem dictionary is not empty.</i>  <i>Post: all the items in the vector item group get treated as one item.</i></p> <p>4. Graphics items are ungrouped.  <i>def unlock_display()</i>  <i>removes all items from vector item group</i>  <i>Pre: GraphicsItem dictionary is not empty.</i>  <i>Post: all the items in the vector item group get treated as individual items.</i></p>	

## 7 Database

### 7.1 Database Schema

The method of data persistence that we the development team decided to use is the data serialization of objects to file storage system. A file is created and objects are serialized or encoded when a save operation is done. When the system is opened the files are then decoded back into their representative objects and data thus persists in this manner.

[END]
